## TITLE:

High-molecular derivatives of  $\alpha$ -methyl styrene. II. Chloromethylation of  $\alpha$ -methyl styrene - divinyl benzene copolymers

## PERIODICAL:

Vysokomolekulyarnyye soyedineniya, v. 5, no. 2, 1963,  
238-242

TEXT: The behavior of  $\alpha$ -methyl styrene - diene copolymers, which differ by their complicated steric structure from styrene polymers and copolymers, was studied by chloromethylation of  $\alpha$ -methyl styrene - divinyl benzene (DVB) copolymers. The copolymer was swelled for 12-14 hrs in monochloro methyl ether; then  $ZnCl_2$ ,  $AlCl_3$ ,  $SnCl_4$ , or  $SnCl_2$  were added as catalysts and the mixture kept for 4-6 hrs at  $60^{\circ}C$ . With copolymer granuli of 0.5 mm diameter a DVB content of 6% and a copolymer : ether ratio of 1 : 7.5, 64-88% chloromethylation was obtained. The degree of conversion increased with increasing concentration of the catalyst. The best effect had  $SnCl_2$  in a

Oard 1/2

S/190/63/005/002/014/024

B101/B102

High-molecular derivatives ...

concentration of 0.3-0.4 mole per benzene ring of the copolymer. Higher concentrations had no significant effect on the chlorine content of the derivative. For a copolymer containing 10% DVB, only 44.6% conversion was obtained at 20°C within 4 days, but 66.2% conversion at 60°C within 6 hrs. After 4 hrs, the chloromethylated copolymer contained with 4% DVB, 15.4% Cl, but with 10% DVB only 10.4% Cl. The degree of conversion decreased when the molar monochloro methyl ether : catalyst ratio was reduced or if the granuli were of larger diameter. There are 5 figures and 1 table. TITLE: Study of the copolymerization of 2-methyl-5-vinylpyridine with dimethylene glycoldimethacrylate

PERIODICAL: Vysokomolekuljarnyye soyedineniya, v. 5, no. 3, 1963, 309-315

TEXT: The copolymer from 2-methyl-5-vinyl-pyridine (MVP) and dimethylene glycol dimethacrylate TGM-3 (TGM-3) is studied with a view to use as an ionite for dephenolizing industrial waste water. For the mass copolymerization of MVP with TGM-3 the studies were made of how induction period, the degree of conversion and the viscosity depend on the ratio of the components, the temperature and the concentration of the benzoyl peroxide used as initiator. Polymerization of pure MVP proceeds without induction period, with the viscosity gradually increasing. In the polymerization of pure TGM-3 the induction period depends on the reaction conditions and the viscosity of the liquid above the gel is almost constant. If MVP is copolymerized with 2 - 30% TGM-3 then the induction period has a minimum. This period is 20 - 60 min at 70 - 80°C with 0.5% benzoyl peroxide. Since at 60°C the induction period is 6 hr under the conditions mentioned, this

Card 1/2

B101/P186

Study of the copolymerization...

temperature cannot be recommended for the industrial manufacture of an-ionite. At a TGM-3 content of the initial mixture of 30 - 70% the induction period attains a maximum. It is 3 hr at 70°C and 70% TGM-3. The maximum degree of conversion, 80% was attained within 4 - 5 hr, at a content of 30 - 70% TGM-3, at 90°C, and in the presence of 0.5% benzoylperoxide. The relative viscosity of the initial mixture increases as the TGM-3 content increases. For mixtures with less than 1% TGM-3 the viscosity strongly rises while with a TGM-3 content of more than 10% the viscosity remains constant within the first 20 min of the reaction. There are 4 figures and 2 tables.

TITLE: High-molecular derivatives of  $\alpha$ -methyl styrene. III. Synthesis and properties of some anionite derivatives of poly- $\alpha$ -methyl styrene

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 5, no. 3, 1963, 445-448

TEXT: Anion exchangers were obtained from  $\alpha$ -methyl styrene cross-linked with 6% divinyl benzene, chloromethylated to a chlorine content of 15%, by amination with pyridine (Py), trimethyl amine (TMA), triethanol amine, diethanol amine, or dimethyl aniline. The degree of conversion was 81.6% with Py and 90.5% with TMA. The optimum exchange capacity was reached by Py and TMA anionites; it was 2.52 mg-equiv/g 0.1 N HCl and 1.48 mg-equiv/g 0.1 N NaCl for the Py variant, and 2.85 and 1.67, respectively, for the anionite with TMA. After contact with 9 N HNO<sub>3</sub>, the exchange capacity was 68.0% of the initial value for TMA anionite, and 66.4% for Py anionite. The loss in exchange capacity after 4 hrs heating at 80°C was 26.3% for Py anionite, and 16.1% for TMA anionite. The best swelling capacity was

TITLE: Synthesis and study of copolymers of 2-methyl-5-vinylpyridine with mono-, di-, and triethylene glycol methacrylates

SOURCE: IVUZ. Khimiya i khimicheskaya tekhnologiya, v. 6, no. 2, 1963, 294-298

TOPIC TAGS: copolymers, 2-methyl-5-vinylpyridine, monoethylene-glycol diethylene-glycol triethylene-glycol methacrylates, ion exchangers, crosslinking agent, absorption capacities, weakly basic resin, strongly basic resin

ABSTRACT: A series of copolymers in bead form were prepared by suspension polymerization. Some were quaternized with benzyl chloride. Both weakly and strongly basic resins were evaluated as ion exchangers and their stability to elevated temperatures, strong nitric acid, and strong alkali were determined and related to the type and quantity of crosslinking agent used. Copolymers of methylvinyl-pyridine with triethylene glycol methacrylate attained the highest absorption capacities, 45-73% by weight of absorbent, towards phenol. Orig. art. has: 5 figures and 2 tables.

TITLE: Investigation of the copolymerization reactions and chemical transformations of copolymers of methyl-substituted styrene with dienes. II. Introduction of mobile chlorine atoms into the structure of copolymers of vinyltoluene with alpha-methylstyrene and divinylbenzene by chloromethylation				
SOURCE: Khimicheskiye svoystva i modifikatsiya polimerov (Chemical properties and the modification of polymers); sbornik statey. Moscow, Izd-vo Nauka, 1964, 28-32				
TOPIC TAGS: methyl-substituted styrene, vinyltoluene copolymer, methylstyrene copolymer, divinylbenzene copolymer, chloromethylation, diene copolymer, chloromethyl ether				
ABSTRACT: The authors investigated the conditions of the introduction of mobile Cl atoms into the molecular structure of vinyltoluene- $\alpha$ -methylstyrene and vinyltoluene-divinylbenzene copolymers by means of monochloromethyl ether. A freshly distilled monochloromethyl ether (b.p. 58.5-59.8C/760 mm) was used. The reaction is described. The effect of the granule size on the Cl content in the chloromethylated product was investigated at the boiling temperature of monochloromethyl ether. 173				

L 40015-65

ACCESSION NR: AT404940

ether, using non-aqueous  $ZnCl_2$  as the catalyst. Analytical data show that by using a highly swollen copolymer, the diameter of the spherical granules does not affect chloromethylation. The high Cl content in the copolymer (more than 20.48%) indicates that two chloromethyl groups enter some copolymer units. It can be assumed that chloromethylation proceeds in two stages. The dependence of Cl content in the chloromethylated product on the time and temperature of reaction and amount and nature of the catalyst was investigated and the data plotted. Data obtained at 18°C on the effect of time in relation to divinylbenzene content showed that with an increasing number of crosslinks in the copolymer structure, the Cl content decreases in the end products. This is due to the decrease in swelling capacity of the copolymer in monochloromethyl ether when the content of the bridge-forming component increases, and hence to the decrease in the permeability of the macromolecular lattice for the molecules of monochloromethyl ether. Data on chloromethylation at 59.5°C, when the copolymer contained different amounts of divinylbenzene, show that an increase in the amount of crosslinking component does not significantly affect the Cl content of the end products at this temperature. This is explained by the fact that at the boiling point of the chloromethylating agent, the swelling capacity of the copolymer increases, and the macromolecular lattice remains accessible to the monochloromethyl ether molecules. The Cl content reaches its theoretical value in 3 hours. The effect of the nature and

Card 2/3

L 40015-65			
ACCESSION NR:	AT4049840		
<p>amount of different catalysts on chloromethylation of copolymers containing 10% <math>\alpha</math>-methylstyrene (by weight of vinyltoluene) and 4.67 divinylbenzene (based on the sum of the above components) was investigated at the b.p. of the chloromethylation agent with a particle size of 0.50-1.00 mm. Tabulated data show that an increase in the amount of catalyst, under otherwise equal conditions, causes the Cl content, incorporated during chloromethylation in a unit time, to increase. On using <math>ZnCl_2</math> and <math>SnCl_4</math> in amounts of 0.0145 and 0.0057 moles per 5 g of copolymer, respectively, the Cl content in the end product reaches its theoretical value in 1 hour. The best results were obtained with <math>SnCl_4</math> and <math>ZnCl_2</math>: the Cl content was 24.67 and 24.92%. This demonstrates the electrophilic substitution by the chloromethyl group which results in the formation of dichloromethyl derivatives. By retaining the correct spherical shape of the granules, the degree of chemical conversion to the corresponding dichloromethyl derivatives was kept at 80-81%. Orig. art. has: 4 tables.</p>

AUTHOR:	Davankov, A. B.; Laufer, V. M.; Kuznetsova, L. B.		
TITLE:	The reaction of poly(vinyl chloride) with pyridine bases		
SOURCE:	IVUZ. Khimiya i khimicheskaya tekhnologiya, v. 8, no. 1, 1965, 127-130		
TOPIC TAGS:	anion exchange resin, graft copolymer, polyvinyl chloride, polymer anionite		
ABSTRACT:	The purpose of this work was to study the replacement of chlorine atoms in poly(vinyl chloride) by pyridine bases and to determine whether chemical grafting with formation of C-C bonds takes place or formation of graft copolymers containing quaternary ammonium functions. Poly(vinyl chloride) and chlorinated poly(vinyl chloride), containing 56.19% and 62.92% Cl, respectively, were mixed with 2-methyl-5-vinylpyridine heated at 160°C and 180°C for two hours and five hours. The resins obtained were extracted with benzene, treated with 2N hydrochloric acid, washed with water and dried under vacuum		
Card 1/2			

L 42962-65				
ACCESSION NO.: AP5010992				
at 35—40°C to constant weight. The low content of residual chlorine in the resin indicated probable loss of HCl in the course of the reaction. The resins were not soluble in cold dichloroethane, dioxane, methanol, and acetone. They were also insoluble in hot dichloroethane, hot methanol, and hot or cold 0.1 N HCl. Judging by the lack of exchange capacity toward a 0.1 N solution of NaCl, the resins contained no quaternary pyridinium groups. They were shown to be weakly basic anion exchange resins with an exchange capacity of 5.4—5.8 mg-equiv/g toward 0.1 N HCl. The authors deduce from experimental data and calculations that at high temperatures quaternary pyridinium functions are converted to tertiary amines; this is accompanied either by homopolymerization of the vinyl groups or condensation via the methyl groups of the pyridine ring. TITLE: Synthesis of optically active ionites

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 3, 1966, 544-546

TOPIC TAGS: ion exchange resin, amino acid, organic amide, hydrolysis

ABSTRACT: An attempt was made to use optically active  $\alpha$ -amino acids and their derivatives for synthesis of ionites according to the following scheme:

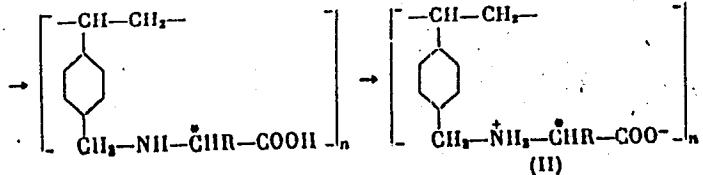

UDC: 542.91+535.56+661.183.123

Card 1/2

L 31881-66

ACC NR: AP6012533

It was shown that chloromethylated styrene-divinylbenzene copolymers do not react with  $\alpha$ -amino acids and their derivatives under conditions which exclude racemization. The conditions for the reaction of iodomethylated styrene-divinylbenzene copolymer with  $\alpha$ -amino acid amides were investigated and anionites on their base were obtained. The potentiometric titrations of ionite obtained on the basis of D,L-leucinamide showed that it is a weakly basic monofunctional anionite. Its swelling in water was very low. It swells much better in dioxane, acetone and especially well in methanol and ethanol. Its amide group can be easily hydrolyzed by boiling in 20% solution of HCl for 3-5 hrs. This produces amphoteric ionite. An optically active anionite was produced from styrene copolymer containing 2% of divinylbenzene with L-leucinamide. Its analytical capacity was 2.90 mg-equiv/g. Using this ionite separation of racemic D,L-mandelic acid was achieved. L(+) mandolic acid of a high degree of optical purity was thus obtained. Hydrolysis of amide groups produced amphoteric ionite. Orig. art. has: 2 figures, 2 tables.

TEXT: The authors investigated some chemical transformations of polyvinyl alcohol. Hereat benzyl ethers of polyvinyl alcohol were obtained with a high content of benzyl groups (66.4%), and their properties were studied. Chloromethylated derivatives of the benzyl ethers of polyvinyl alcohols were obtained. It is established that the disintegration of the polymers in consequence of nitrating of the benzyl ethers of polyvinyl alcohol and subsequent reduction of the nitro groups into amino groups is observed, which leads to compounds that are soluble in alkali hydroxides; highmolecular quaternary ammonium bases with exchange capa-

TOPIC TAGS: methylation, bromine, iodine, copolymer

ABSTRACT: This Author Certificate describes proposed methods for preparing the iodo- and bromomethylated copolymer of styrene with divinylbenzene, an intermediate product for synthesizing ion-exchange resins from the chloromethylation product of a copolymer. To obtain a higher yield of compounds containing highly active elements in subsequent reactions, the chloromethylation product is treated with solutions of iodides and bromides of alkali metals in organic solvents.

✓ Reduction of unsymmetrical diene hydrocarbons with calcium hexaammoniate. B. A. Karaszki, I. V. Gostunskaya, E. A. Davankova, and E. G. Treshchova (M. V. Lomonosov State Univ., Moscow). *Doklady Akad. Nauk S.S.R.* 105, 485-8 (1955); cf. *C.A.* 50, 5540b.—Dehydrogenation of 3,4-dimethyl-3,4-hexanediol with  $H_3PO_4\cdot Ac_2O$  gave 3-methyl-2-ethyl-1,3-pentadiene,  $\delta_{\text{D}}^{13}$  136.3°,  $\pi^{\text{CDCl}_3}_{25}$  1.4700,  $d_{10}^{25}$  0.7918. This (31.2 g.) was reduced with Ca hexaammoniate (from 40 g. Ca) yielding 28.5 g. mixed products identified as 3-methyl-2-ethyl-1-pentene, 3,4-dimethyl-2-hexene, and 3,4-dimethyl-3-hexene (18%, 52%, 35%, resp.). Reduction of 65.1 g. 2-methyl-2,4-hexadiene with Ca hexaammoniate (from 92 g. Ca) gave 53.7 g. products composed of 31% *trans*-2-methyl-3-hexene, 20% *trans*-4-methyl-2-hexene and 49% 2-methyl-2-hexene, identified by Raman spectra. The Raman spectrum of 2-methyl-2-hexene is ( $\text{cm.}^{-1}$ ) 270(10), 325(3.5), 345(3), 378(3.5), 421-34(4.5), 403(6.5), 512(6.3), 547(0), 587(0), 736(4.0), 763(6.5), 789(8), 832(6), 869(2), 897(2), 981(0), 1040(14), 1072(22), 1089(20), 1117(0), 1144(18.5), 1170(12), 1196(11), 1240(9), 1268(4), 1296(9), 1324(1), 1339(20.5), 1353(12), 1382(51), 1437(65), 1458(71), 1474(12). AUTHORS: Zherdev, I.T., Davatts, V.N.

TITLE: Measurement of current density in the melt of an electric corundum furnace

PERIODICAL: Referativnyy zhurnal. Metallurgiya, no. 11, 1961, 1, abstract 1103 ("Nauchn. trudy Dnepropetr. metallurg. in-t", 1959, no. 40, 49-54)

TEXT: The authors describe the method for measuring the current density of the electro-corundum melt. Probes with graphite plates were used for measuring. The measurements were carried out after opening the top during full-power operation of the furnace. The probes were inserted into the liquid melt in the middle between the electrodes of the furnace to a depth of 300-500 mm. The mean values of the current density are 1.78-1.9 amperes/cm<sup>2</sup>, and those of the resistivity are 0.55-0.74 ohm/cm.

V. Neyman

"Testing of Gastric Secretion with Nicotinic Acid"

Zagreb, Lijecnicki Vjesnik, Vol 88, No 5, pp 481-488

Abstract: Stimulation of gastric secretion by nicotinic acid was studied on 239 patients with gastric and extragastric disorders. The results obtained with nicotinic acid (100 mg) were similar to those obtained with histamine (0.5 mg). The nicotinic acid test proved particularly useful in the determination of acidity in ulcerative gastric changes, non-ulcerative dyspepsia, and gastritis. It was superior to the caffeine test, showing acidity in cases in which wrong values indicating achylia were obtained by the latter. The maximum test with doses of 150 mg nicotinic acid was applied to 147 patients in cases in which the ordinary test indicated achylia. Side effects in tests with the maximum dose of nicotinic acid were more frequent and pronounced than in tests with the ordinary, lower dose. Graphs and tables, 11 references (1 Yugoslav, 10 Western). English summary. Manuscript received 20 Jun 65.

Belgrade, Medicinski Glasnik, Vol 16, No 10-12, Oct-Dec 1962; pp 449-442.

**Abstract:** About 2 years of prednisone treatment with doses averaging 40 milligrams daily in 3 patients aged 34, 47 and 65 and all 3 with peptic ulcer showed no sign of gastric ulcer or any prodromal signs of this side effect. There was osteoporosis in 1, moon face in all 3. There should be no fear to prolong necessary corticosteroid treatment in carefully supervised patients. Three photographs, 1 Yugoslav and 14 Western references. /French summary modified./

Budapest, Orvosi Hetilap, Vol 104, No 14, 7 Apr 63, pages 631-634.

Abstract: [Authors' Hungarian summary] Single i.m. doses of 150 U Hyason were given to 19 exophthalmic patients in 24 instances. 16 progressive, 3 non progressive cases of exophthalmus were included in the study. Six hours after the injection, 1.5-5 mm decrease of the Hertel-values was noted in 11 cases. In 3 cases the eye-lid swelling decreased and a decrease of the pressure in the eye-region was noted by the patients. No unpleasant side effects were observed. Attention is called to the beneficial influence of i.m. Hyason on the eye in cases of acute decompensation of endocrine exophthalmi. The possible ways of the action mechanism are discussed by the authors. 5 Hungarian, 2 Western references.

NAME & BOOK EXPLANATION

cluj, Transylvanie, Institutul Politehnic  
Central Primitivă (Scientific Works), Cluj, Interindustria Politehnica, 1959.  
(57 p.) Some also inserted. No or copies printed not given. No  
contributors mentioned.

PURPOSE: This book is intended for mathematicians, physicists, chemists, and  
civil and mechanical engineers.

CONTENTS: The book consists of 59 papers by Romanian specialists on problems in  
science and technology, particularly mechanics, physics, chemistry, mathematics,  
metallurgy, civil and mechanical engineering, materials in plants and  
French or German are given at the end of each article. Some of the articles  
are accompanied by references. No personal names are mentioned. At the back  
of the book there are 25 references, all Romanian.

Abstract	:	The primary activation proceeded for $\geq 10$ hours. The obtained charcoal had an activity (basis methyl blue) by 43% higher compared to that of commercial product. The secondary activation of charcoal results in a still higher activity. Properties of the obtained charcoal are compared favorably with those of activated charcoals produced by the industry. -- Ya. Matlis.

TITLE: New developments in the field of permivar ferrites and their applications

SOURCE: Przeglad elektroniki, no. 12, 1964, 639-645

TOPIC TAGS: ferrite, permivar ferrite, temperature dependence, field dependence, permeability, quality factor

ABSTRACT: Tests were made of nickel-zinc ferrites with cobalt additive for the purpose of establishing the connection between the production technology and the properties of permivar ferrites. The tested ferrites covered a wide range of compositions, and the best results were obtained with ferrites in which the oxide contained a large fraction (up to 50%) geothite. The ZnO/NiO ratio ranged from 0 to 2.45, and the Fe<sub>2</sub>O<sub>3</sub> excess was maintained constant. The resultant ferrites had initial permeabilities up to 200 G/Oe and very low losses (Q up to 2000) up to 200 Mc. The initial permeability was greatly affected by the sintering temperature and by the external magnetic field. Several applications of such per-

minvar ferrites are discussed; these include antenna wires and cores for radio and television coils and filters at various frequencies. Some theoretical problems concerning the mechanism of production of the permianvar structure and the influence of the temperature and of the external field remain to be solved, and the question of the applicability of such ferrites for miniature and micro-miniature circuits remains open. Orig. art. has: 4 tables.
